

Requirements Gathering – Library System

DB Design and Development Final Project

Connor Slutsky

7/17/26

1. The library system holds all books that are in use by the library. For books, the system includes information such as title, author, date published, publisher, and genre. A book also contains a status for whether it's borrowed or not. For the sake of simplicity, there will be only one author stored per book.
2. Staff are those at the library that can manage the system, such as by adding new books or removing books that are no longer in circulation. For staff members, the system includes information such as name, date of birth, position (clerk vs. manager), salary, email address, phone number, and address (consisting of street, city, state, and zip). For the sake of simplicity, the system will store only one email address and phone number.
3. Customers are those that are registered in the library system after having applied for and obtained a library card. Information includes name, date of birth, address (same components as for staff), email address, phone number, as well as what books they are currently borrowing. A customer may only have one library card, and a library card may only be used by that customer. Similar to staff, the system will only store one email address and phone number for each customer, for the sake of simplicity.
4. For library cards, the system tracks the date it was issued, and the customer that it belongs to.
5. In order to borrow a book, customers need to register for a library card, and they cannot borrow a book that is already borrowed by someone else. When they borrow a book, they are given the choice of a date that they intend to return the book (with a maximum of 2 months from the date of borrowing).
6. When customers borrow one or more books, a staff member oversees the transaction. The system tracks the date of this borrowing, and the expiration of the book being borrowed.
